Pred. No. is the number of results predicted by chance to have a em_htgo_mus:* em_htgo_other:*

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Novel isolated PAAD domain containing polypeptide useful for inducing apoptosis by inhibiting nuclear factor kappa B activation and in gene therapy for treating cancer.

Claim 2; SEQ ID NO 23; 93pp; English

엄

ò d δ g ò g à g

The invention describes an isolated PAAD domain containing polypeptide containing 80% identity to the amino acid sequence of PAAD and nucleotide binding protein (PAN) 2-6, pyrin 2, apoptosis-associated speck containing a caspase recruitment domain (ASC)-2 fully defined in specification, where (I) is biologically active. (I) is useful correlation and agents that modulate papelide, an agent altering that association and agents that modulate PAAD domain mediated inhibtion of nuclear factor kappa B (NFkappaB). A NB-ARC domain polypeptide is useful correlating an agent that modulates the activity of the NB-ARC domain of inclear factor kappa B (NFkappaB). A NB-ARC domain polypeptide is useful for its functional fragments is useful in altering cellular or blochemical process such as apoptosis, NFkappaB induction, cytokine process such as apoptosis, NFkappaB induction, cytokine correceptor signaling caspase-mediated proteclysis or C Jun N-terminal kinase activation, thus having modulating effect on cell ife and death (apoptosis) inflammation, cell adhesion or other cellular or blochemical processes. (I) is useful for treating cancer pathologies, keratinocyte, hyperplasia, neoplasia, keloid benign prostatic pathologies, keratinocyte, hyperplasia, neoplasia, keloid benign prostatic collupus, schrojen's syndrome, Crohn's diseases such as allergies, arthritis, leukaemia, lymphomas; inflammatory diseases such as allergies, arthritis, versus host disease, thuman immunodeficiency virus infection (HIV). (I) is useful for disagnosing cancer or monitoring cancer or manicoring concername.

involving impaired signal transduction, particularly inflammation, also Fig 1; 116pp; German proteins and antibodies. 5; Claim and the

The present invention relates the DNA and their encoded proteins, where the proteins contain at least one PYD (pyrin) domain. These can be used to treat diseases associated with impaired intracellular signal transduction, particularly inflammation such as psoriaeis, arteriosclerosis, bacterial or viral infections (particularly meningitis ard preumonia), multiple sclerosis, rhemmatoid arthritis, asthma, sarcoidosis, glomerulonephritis and osteoarthritis, and also Alzheimer's and Parkinson's diseases. The present sequence is a coding sequence of

```
The invention comprises the amino acid and coding sequences of human PPRIN proceins. The PYRIN procein and DNA sequences of the invention are useful for modulating and diagnosing stress-related, apoptopic and inflammatory responses. The PYRIN protein and DNA sequences are useful corn's disease. The TRIN protein and DNA sequences are useful crohn's disease. Teactive arthritis, multiple sclerosis, contact dermatitis, psoriasis, graft rejection, allergies, viral infections and bacterial infections); cancer (e.g. leukaemia); autoimmune disorders (e.g. systemic lupus erythematosus and arthritis); and neurological diseases (e.g. Alzheimer's disease and Parkinson's disease). The PYRIN protein and DNA sequences may also be used in screening assays, detection sassays (e.g. chromosomal mapping, tissue typing or forensic biology), predictive medicine (e.g. diagnostic assays, clinical trials and pharmacogenomics), and transcription profiling. The present DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 3186 BP; 701 A; 908 C; 945 G; 632 T; 0 U; 0 Other;

The invention relates to 971 novel human cDNA sequences (ADC29919-ADC30889) and the polypeptides they encode (ADC30890-ADC31860). The ADC30889) and the polypeptides they encode (ADC30890-ADC31860). The convention also relates to nucleic acid sequences over 95% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the cecombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; an antibody captinat a polypeptide of the invention; and methods of polymetheristic of invention in antibody against a polypeptide of the invention. The invention further discloses methods of peventing, treating or ameliorating a medical condition; Ats comprising polymucleotide probes invention; methods for the identification of compounds that medical and 767 canting sequences corresponding to the convention for polypeptide; and 767 conting sequences corresponding to the cDNA sequences of the invention are (ADC31861-ADC32627) and the polymucleotides and/or polypeptide; and 767 conting sequences corresponding to the cDNA sequences of the invention are useful in diagnostics, drug screening, forensics, gene mapping, in the captas, for assessing biodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are corresponding diseases such as Parkinson's disease, Alzheimer's disease and other neurodegenerative diseases, aneamia, platelet cancer. The nucleic acids may also be used as hybridisation probes or cancer. The nucleic acids may also be used as hybridisation probes or Claim 1; SEQ ID NO 398; 1185pp; English.

primers, and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically claimed human cDNA sequence of the invention. Note: The sequence data for this patent did not form pat of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

WPI; 2003-140627/13. P-PSDB; ABU99119 New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis, or diabetes, and in chromosome mapping, tissue typing or pharmacogenomics

Claim 20; Page 98-99; 332pp; English.

The invention describes an isolated polypeptide (I) comprising any of 27 (18-961 residue amino acid sequences, given in the specification, a mature form of them, a sequence that is at least 95 % identical to them, or a sequence having one or more conservative substitutions in them. The polypeptide is useful in manufacturing a medicament for treating a syndrome associated with a human disease selected from a pathology associated with the polypeptide. The NoVx polypeptides, polynucleotides and antibodies are useful in treating or preventing NoVx-associated disorders, e.g. cardiomyopathy, atherosclerosis, cancer, disorders, parkinson's disorders, pathology associated cachesia, and other wasting disorders associated with chronic disease. Alzheimer's disease, infections, multiple sclerosis, cancer-associated cachexia, and other wasting disorders associated with chronic diseases. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit e.g. chorthe identification of small molecules that modulate or inhibit e.g. convoids that bind immunospecifically to NOVX substances for use in contribodies that bind immunospecifically to NOVX substances for use in therapeutic or diagnostic methods. The nucleic acids are further used as nuthodies that bind immunospecifically to NOVX substances for use in therapeutic or diagnostic methods. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The polypeptides are also useful as

WPI; 2002-723320/78. P-PSDB; ABG97475, New human nucleic acid-associated proteins (NAAP), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant NAAP expression, e.g. cancer, hepatitis, AIDS, atherosclerosis, infections.

Claim 5; Page 160; 162pp; English.

human nucleic acid associated polypeptide comprising one of 10 human nucleic acid associated protein (NAAPI-10), or a biologically active or immunogenic fragment of the polypeptide, and their emcoding nucleic acid. Also included are a recombinant polynucleotide and their emcoding promoter sequence operably linked to the polypucleotide, a call comprising to promoter sequence operably linked to the polynucleotide, a call comprising the recombinant polynucleotide, an anti-NAAP antibody.

Comprising the recombinant polynucleotide an anti-NAAP antibody.

Comprising the recombinant polynucleotide of a sample containing the polynucleotides and an array comprising different nucleotide molecules affixed on a solid substrate, nucleotide molecule containing the polypeptides and an array comprising different nucleotide molecules at least 30 contiguous nucleotides see useful in diagnosing, treating and preventing diseases or conditions associated with the decreased and preventing diseases or conditions associated with the decreased compression or overexpression of NAAP, such as cell proliferative diseases (e.g. cancer, atherosclerosis, hepatitis), neurological disorders (e.g. cancer, atherosclerosis, hepatitis), neurological disorders (e.g. cancer, atherosclerosis, hepatitis), neurological disorders (e.g. bacterial, viral, parasitic, protozoal, fungal) and many other diseases and disorders listed in the specification. The expression custful in assessing the effects of exogenous compounds on the expression conternial and sequences of NAAP. The NAAP or its fragments are useful in screening compounds for effectiveness as agonist or antagonist of the polypeptides, or in altering the expression of the target polynucleotide and compounds that specifically bind to or modulate the activity of the polypeptide. The microarray is useful in monitoring or measuring protein-protein interactions, drug-target interactions, and gene expression profiles. The present sequence encodes an NAAP protein

modulating signal transduction activity in various cells, tissue and organisms. They are also useful for treating, preventing, or diagnosing diseases of haematopoietic cells, autoimmune disease, graft-versus-host disease, allergic conditions (e.g. asthma), cardiovascular disorders, and neurological diseases, and for increasing the organisms' ability to synthesize and/or release pheromones. The polypeptide may also be used in treating, preventing or ameliorating pulmonary disease (e.g. chronic obstructive pulmonary disease, allergic rhinitis, or bronchial hyperresponsiveness), reproductive disease, haematopoietic disease, platelat disorders (e.g. Bernard-Soulier syndrome), non-infectious disorders (e.g. bernard-Soulier syndrome), non-infectious disorders (e.g. innate immunity to bacterial pathogens, or adaptive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1081 AATGCGCGCCTAGGGCAATGTGTCAACCTCAGCCACCGGTACACCCGGCTCCTGCTGGTG 1140

                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence encodes a human leucine-rich repeat containing protein, designated HLRRBM1. HLRRBM1 polypeptides and polymucleotides are useful for preventing, treating or ameliocating a medical condition such as a proliferative disorder, immune condition, or a disorder related to aberrant apoptosis modulation, either directly or indirectly, and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             468
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GAGGAGCGCCCCGAGCCACCGCGCACCGTGGTCATGCAAGGCGCGGCAGGGATAGGCAAG 588

```
The invention describes an isolated polypeptide (I) comprising any of 27 (18-961 residue amino acid sequences, given in the specification, a mature form of them, a sequence that is at least 95 % identical to them, or a sequence having one or more conservative substitutions in them. The polypeptide is useful in manufacturing a medicament for treating a spondance associated with a human disease selected from a pathology associated with the polypeptide. The NOVX polypeptides, polymolectides and antibodies are useful in treating or preventing NOVX-associated and antibodies are useful in treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, atherosclerosis, cancer, diabetes, immune disorders, AlDS, obesity, athma, haematopoietic disorders, Parkinson's disease, Alzheimer's disease, infections, multiple solerosis, cancer-associated cachexia, and other wasting disorders associated with chronic diseases. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and angiogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NOVX substances for use in therapeutic or diagnostic methods. The nucleic acids are further used as

```
The invention relates to a new method for the identification of a compound that binds to a human PYRIN-1 (an apoptotic signalling molecule appearing as ABU08503) comprising contacting the polypeptide or a cell expressing the polypeptide to a test compound and determining whether appearing as ABU085031 comprising contacting the polypeptide or a cell expressing the polypeptide to a test compound and determining whether compound on the activity of PYRIN-1 to ASC (comprising testing compound on the activity of NF-NE (muclear factor KB), and which modulate the binding of pressing of NF-NE (comprising testing compounds against the pyrin binding domains of both PYRIN-1 and ASC-mediated activation of NF-NE (comprising: (a) measuring the binding of a test compound to the LRR (leucine rich repeat) comparing ASC and PYRIN-1; and (b) measuring the activition of NF-NE (comprising a measuring the binding of a test compound to the LRR (leucine rich repeat) compared to a propound). The candidate medulators may be useful for treating an inflammatory disorder. Also included is a method (M8) for identifying a modulator of cappase-1 activity. The identified compound can be used to patient). By modulating the expression or activity of the polypeptide or modulate the polypeptide's activity (ASC and NF-NE activity) and ASC), a disorder associated with inappropriate apoptosis (inflammatory disorders e.g. familial cold urticaria, arthritis, intellammatory disease, leasten, contact dermatitis, sportasis, graft versus host disease, asthma, chronic obstructive pulmonary disease, allergies cold activities in the cold allergies), conjunctivitis, helminthic infections such as tubercoulosis and leprosy) can be treated. Human NBC-1 infections such as tuberculosis and leprosy) can be treated. Human NBC-1 infections such as tuberculosis and leprosy) can be treated. Human PYRIN-1 gene for pyrin-1 is located on chromosome lef44. The present sequence
                                                                                                                                                                                                                                                                                                                                        Identification of compound that binds to polypeptide (for e.g. a PYRIN protein), useful for treating disorders associated with inappropriate apoptosis, for e.g. inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                              Disclosure, Fig 4; 74pp; English.

The invention relates to a compound that binds to a polypeptide (e.g. PYRIN-1 or NBS-1). The nucleic acid molecules, proteins, protein homologues and antibodies incorporated in the invention can be used in screening assays; detection assays (e.g. chromosomal mapping, tissue typing, forensic biology); predictive medicine (e.g. diagnostic assays, prognostic assays, monitoring clinical trials, and pharmacogenomics); and methods of treatments (e.g. therapeutic and prophylactic). When NBS-1 or PYRIN-1 protein interacts with other cellular proteins, they can be used for regulation of cellular proliferation and differentiation, and regulation of cell survival. The isolated nucleic acid molecules of the

```
invention can be used to express NBS-1 or PYRIN-1 protein to detect NBS-1

or PYRIN-1 mRNA or a genetic lesion in NBS-1 or PYRIN-1 gene and to
modulate NBS-1 or PYRIN-1 activity. These proteins can be used to screen
drugs or compounds which modulate the NBS-1 or PYRIN-1 activity or
compounds which modulate the NBS-1 or PYRIN-1 activity or
compounds which modulate the NBS-1 or PYRIN-1 antibodies of the
invention can be used to detect and isolate NBS-1 or PYRIN-1 proteins and
invention can be used to detect and isolate NBS-1 or PYRIN-1 proteins and
conscisted with inappropriate apoptosis and inflammatory disorder can be
treated; and the apoptosis associated speck like protein (ASC) and
conclear factor (NP)-kappad activity in a patient can be modulated by
administering the compound that alters the activity of PYRIN-1. The
method takes advantage of the interactions between NBS-1 or PYRIN-1 and
various proteins involved in apoptotic and inflammatory signaling
pathways. The nucleic acid molecules of the invention can be inserted
into vectors. The present sequence represents cDNA encoding the human
process pyrin domain family protein PYRIN-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1057
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1118 ACATTCTCCTGAGCAGCCTCATCAGAAGAAGCTGCTTCCCGAGGCCTCTCTGCTCATCA 1177

Disclosure, SEQ ID NO 58, 93pp, English.

The invention describes an isolated PAAD domain containing polypeptide

(1) comprising 80% identity to the amino acid sequence of PAAD and

nuclectide binding protein (PAN) 2-6, pyrin 2, apoptosis-associated speck

-like protein containing a caspase recruitment domain (ASC)-2 fully

defined in specification, where (I) is biologically active. (I) is useful

contidentifying a (I) associated polypeptide, an agent altering that

association and agents that modulate PAAD domain mediated inhibition of

nuclear factor kappa B (NRkappaB). A NB-ARC domain polypeptide is useful

contidentifying an agent that modulates the activity of the NB-ARC domain

contidentifying an agent that modulates the activity of the NB-ARC domain

contidentifying an apoptosis, NFkappaB induction, cytokine

processing, cytokine receptor signaling caspase-mediated proteolysis or c

Jun N-terminal kinase activation, thus having modulating effect on cell

contined processes. (I) is useful for treating cancer pathologies,

keratinocyte, hyperplasia, neoplasia, keloid benign protestic

chypertrophy, inflammatory hyperplasia, fibrosis, smooth muscle cell

contained the process of the proplasia and polypersy (restenosis),

land and activity of a manerow, allopases

contained the process of the proplasia and polypersy (restenosis),

land and activity of a manerow, allopases

contained the process of the proplasia, and polypersocial and activity of the proplasia, and allops and activity and activity of the problasmant of the proplasia, and activity activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activi leukaemia, lymphomas; inflammatory diseases such as allergies, arthritis, lupus, schrojen's syndrome, Crohn's disease and ulcerative colitis, graft versus host disease, stroke, heart failure, neurodegenerative diseases such as parkinson's and Alzheimer's disease, human immunodeficiency virus infection (HIV). (I) is useful for diagnosing cancer or monitoring cancer therapy. This sequence encodes a human PAAD domain associated protein.
